- Equivalent algebraic semantics for MTL<sup>+</sup> is the variety of representable, integral, commutative residuated lattices.
- An integral commutative residuated lattice (ICRL) is a lattice ordered algebra A = ⟨A, ∧, ∨, ·, →, e⟩ where ⟨A, ·, e⟩ is a commutative monoid, e is a top element, and xy ≤ z iff x ≤ y → z.

- Equivalent algebraic semantics for MTL<sup>+</sup> is the variety of representable, integral, commutative residuated lattices.
- An integral commutative residuated lattice (ICRL) is a lattice ordered algebra A = ⟨A, ∧, ∨, ·, →, e⟩ where ⟨A, ·, e⟩ is a commutative monoid, e is a top element, and xy ≤ z iff x ≤ y → z.
- A representable ICRL is an ICRL which is isomorphic to a subdirect product of totally ordered members.

イロト イ団ト イヨト イヨト

- Equivalent algebraic semantics for MTL<sup>+</sup> is the variety of representable, integral, commutative residuated lattices.
- An integral commutative residuated lattice (ICRL) is a lattice ordered algebra A = ⟨A, ∧, ∨, ·, →, e⟩ where ⟨A, ·, e⟩ is a commutative monoid, e is a top element, and xy ≤ z iff x ≤ y → z.
- A representable ICRL is an ICRL which is isomorphic to a subdirect product of totally ordered members.
- Thus SI-members in our variety are chains. We denote them shortly ICRCs.

# Main result

#### Theorem

Each finitely generated ICRC can be embedded into a 1-generated ICRC.

• • • • • • • • • • • • •

# Main result

#### Theorem

Each finitely generated ICRC can be embedded into a 1-generated ICRC.

#### Corollary

The variety of representable integral commutative residuated lattices is generated (as a quasi-variety) by its 1-generated finite totally ordered members.

# Lexicographic product

#### Lemma

Let **A**, **B** be ICRCs such that **A** is cancellative. Then the lexicographic product  $\mathbf{A} \times \mathbf{B}$  is an ICRC.

# Lexicographic product

#### Lemma

Let **A**, **B** be ICRCs such that **A** is cancellative. Then the lexicographic product  $\mathbf{A} \times \mathbf{B}$  is an ICRC.

$$\langle a, x \rangle \to \langle b, y \rangle = \begin{cases} \langle a \to_A b, 1_B \rangle & \text{if } a \cdot_A (a \to_A b) <_A b, \\ \langle a \to_A b, x \to_B y \rangle & \text{otherwise.} \end{cases}$$

In particular, if  $\mathbf{A} = \mathbf{Z}^-$ , then for  $\langle a, x \rangle > \langle b, y \rangle$  we have

$$\langle a, x \rangle \rightarrow \langle b, y \rangle = \langle b - a, x \rightarrow_B y \rangle$$
.

< ロ > < 同 > < 回 > < 回 >

### Nucleus and conucleus

#### Definition

A closure operator γ on an ICRL L = ⟨L, ∧, ∨, ·, →, e⟩ is called a nucleus if γ(x)γ(y) ≤ γ(xy).

#### Nucleus and conucleus

#### Definition

- A closure operator γ on an ICRL L = ⟨L, ∧, ∨, ·, →, e⟩ is called a nucleus if γ(x)γ(y) ≤ γ(xy).
- An interior operator σ on an ICRL L = ⟨L, ∧, ∨, ·, →, e⟩ is called a conucleus if σ(e) = e and σ(x)σ(y) ≤ σ(xy).

## Nucleus and conucleus

#### Definition

- A closure operator γ on an ICRL L = ⟨L, ∧, ∨, ·, →, e⟩ is called a nucleus if γ(x)γ(y) ≤ γ(xy).
- An interior operator σ on an ICRL L = ⟨L, ∧, ∨, ·, →, e⟩ is called a conucleus if σ(e) = e and σ(x)σ(y) ≤ σ(xy).

**TACL 2009** 

6/12

Let  $\gamma : L \to L$  be an operator on *L*. The image of  $\gamma$  is denoted  $L_{\gamma}$ .

# Closure retraction and interior extraction

Lemma

 An operator γ on L is nucleus iff L<sub>γ</sub> satisfies min{a ∈ L<sub>γ</sub> | x ≤ a} exists for all x ∈ L.

and

$$x \rightarrow y \in L_{\gamma}$$
 for all  $x \in L$  and  $y \in L_{\gamma}$ .

 $L_{\gamma}$  is called nuclear (closure) retraction.

# Closure retraction and interior extraction

#### Lemma

 An operator γ on L is nucleus iff L<sub>γ</sub> satisfies min{a ∈ L<sub>γ</sub> | x ≤ a} exists for all x ∈ L.

and

$$x \rightarrow y \in L_{\gamma}$$
 for all  $x \in L$  and  $y \in L_{\gamma}$ .

 $L_{\gamma}$  is called nuclear (closure) retraction.

 An operator σ on L is conucleus iff L<sub>σ</sub> is a submonoid of L and max{a ∈ L<sub>σ</sub> | a ≤ x} exists for all x ∈ L. L<sub>σ</sub> is called conuclear (interior) contraction.

• • • • • • • • • • • •

# **Resulting ICRCs**

#### Lemma

If  $\mathbf{L} = \langle L, \wedge, \vee, \cdot, \rightarrow, e \rangle$  is an ICRC and  $\gamma$  a nucleus on it, then  $\mathbf{L}_{\gamma} = \langle L_{\gamma}, \wedge, \vee, \circ_{\gamma}, \rightarrow, e \rangle$  is an ICRC, where  $\mathbf{x} \circ_{\gamma} \mathbf{y} = \gamma(\mathbf{x} \cdot \mathbf{y})$ .

# **Resulting ICRCs**

#### Lemma

If  $\mathbf{L} = \langle L, \wedge, \vee, \cdot, \rightarrow, e \rangle$  is an ICRC and  $\gamma$  a nucleus on it, then  $\mathbf{L}_{\gamma} = \langle L_{\gamma}, \wedge, \vee, \circ_{\gamma}, \rightarrow, e \rangle$  is an ICRC, where  $\mathbf{x} \circ_{\gamma} \mathbf{y} = \gamma(\mathbf{x} \cdot \mathbf{y})$ .

#### Lemma

If  $\mathbf{L} = \langle L, \wedge, \vee, \cdot, \rightarrow, \mathbf{e} \rangle$  is an ICRC and  $\sigma$  a conucleus on it, then  $\mathbf{L}_{\sigma} = \langle L_{\sigma}, \wedge, \vee, \cdot, \rightarrow_{\sigma}, \mathbf{e} \rangle$  is an ICRC, where  $\mathbf{x} \rightarrow_{\sigma} \mathbf{y} = \sigma(\mathbf{x} \rightarrow \mathbf{y})$ .

## Sketch of the proof

Let **A** be an ICRC generated by  $\{a, b, c\}$ . We will construct a 1-generated ICRC in which **A** can be embedded.

< ロ > < 同 > < 回 > < 回 >

## Sketch of the proof

Consider the lexicographic product  $\mathbf{Z}^- \stackrel{\sim}{\times} \mathbf{A}$ . The elements are tuples  $\langle x, y \rangle$  where  $x \in \mathbf{Z}^-$  and  $y \in \mathbf{A}$ .

Rostislav Horčík (ICS, AS CR)

< ロ > < 回 > < 回 > < 回 > < 回</p>

### Sketch of the proof

Take the conuclear contraction of  $\mathbf{Z}^- \stackrel{\sim}{\times} \mathbf{A}$  by deleting  $\{\langle -1, y \rangle \mid y > a\} \cup \{\langle -2, y \rangle \mid y > b\} \cup \{\langle -3, y \rangle \mid y > c\}$ . Denote the corresponding conucleus  $\sigma$ .

Rostislav Horčík (ICS, AS CR)

## Sketch of the proof

Consider the nucleus  $\gamma(x) = x \lor \langle -8, e \rangle$  and its corresponding nuclear retraction.

#### Sketch of the proof

Finally, let **C** be the subalgebra generated by the element  $g = \langle -1, a \rangle$ . We will prove that **A** can be embedded into **C**.

## Sketch of the proof

First, we have  $g^8 = \gamma(\langle -1, a \rangle^8) = \gamma(\langle -8, a^8 \rangle) = \langle -8, e \rangle$ .

・ロト ・ 四ト ・ ヨト ・ ヨト

#### Sketch of the proof

Then  $g \to_{\sigma} g^8 = \sigma(\langle -1, a \rangle \to \langle -8, e \rangle) = \sigma(\langle -7, e \rangle) = \langle -7, e \rangle.$ 

Rostislav Horčík (ICS, AS CR)

TACL 2009 9 / 12

<ロ> <四> <四> <四> <四> <四</p>

#### Sketch of the proof

Then  $g^2 \rightarrow_{\sigma} g^8 = \sigma(\langle -2, a^2 \rangle \rightarrow \langle -8, e \rangle) = \sigma(\langle -6, e \rangle) = \langle -6, e \rangle.$ 

Rostislav Horčík (ICS, AS CR)

TACL 2009 9 / 12

<ロ> <同> <同> <同> <同> <同> <同> <同> <同> <

#### Sketch of the proof

Then  $g^3 \rightarrow_{\sigma} g^8 = \sigma(\langle -3, a^3 \rangle \rightarrow \langle -8, e \rangle) = \sigma(\langle -5, e \rangle) = \langle -5, e \rangle.$ 

Rostislav Horčík (ICS, AS CR)

TACL 2009 9 / 12

<ロ> <同> <同> <同> <同> <同> <同> <同> <同> <

#### Sketch of the proof

Then  $g^4 \rightarrow_{\sigma} g^8 = \sigma(\langle -4, a^4 \rangle \rightarrow \langle -8, e \rangle) = \sigma(\langle -4, e \rangle) = \langle -4, e \rangle.$ 

Rostislav Horčík (ICS, AS CR)

TACL 2009 9 / 12

#### Sketch of the proof

Then  $g^5 \rightarrow_{\sigma} g^8 = \sigma(\langle -5, a^5 \rangle \rightarrow \langle -8, e \rangle) = \sigma(\langle -3, e \rangle) = \langle -3, c \rangle.$ 

Rostislav Horčík (ICS, AS CR)

TACL 2009 9 / 12

#### Sketch of the proof

Then  $g^6 \rightarrow_{\sigma} g^8 = \sigma(\langle -6, a^6 \rangle \rightarrow \langle -8, e \rangle) = \sigma(\langle -2, e \rangle) = \langle -2, b \rangle.$ 

Rostislav Horčík (ICS, AS CR)

TACL 2009 9 / 12

<ロ> <同> <同> <同> <同> <同> <同> <同> <同> <

# Sketch of the proof

We have 
$$\langle -5, e \rangle \rightarrow_{\sigma} \langle -1, a \rangle \langle -4, e \rangle = \sigma(\langle -5, e \rangle \rightarrow \langle -5, a \rangle) = \sigma(\langle 0, a \rangle) = \langle 0, a \rangle.$$

Rostislav Horčík (ICS, AS CR)

イロト イヨト イヨト イヨト

#### Sketch of the proof

We have  $\langle -6, e \rangle \rightarrow_{\sigma} \langle -2, b \rangle \langle -4, e \rangle = \sigma(\langle -6, e \rangle \rightarrow \langle -6, b \rangle) = \sigma(\langle 0, b \rangle) = \langle 0, b \rangle.$ 

(日)

## Sketch of the proof

We have 
$$\langle -7, e \rangle \rightarrow_{\sigma} \langle -3, c \rangle \langle -4, e \rangle = \sigma(\langle -7, e \rangle \rightarrow \langle -7, c \rangle) = \sigma(\langle 0, c \rangle) = \langle 0, c \rangle.$$

Rostislav Horčík (ICS, AS CR)

イロト イヨト イヨト イヨト

## Sketch of the proof

Thus  $\langle 0, a \rangle, \langle 0, b \rangle, \langle 0, c \rangle \in \mathbf{C}$ , i.e. **C** contains an isomorphic copy of **A**.

イロト イヨト イヨト イヨト

## Corollary

#### Corollary

Let *T* be a finite theory and  $\varphi$  be a formula such that  $T \not\vdash \varphi$ . Then there is a substitution  $\sigma$  such that  $\sigma(T) \not\vdash \sigma(\varphi)$  and  $\sigma(T), \sigma(\varphi)$  contain only a single propositional variable.

# Corollary

#### Corollary

Let *T* be a finite theory and  $\varphi$  be a formula such that  $T \not\vdash \varphi$ . Then there is a substitution  $\sigma$  such that  $\sigma(T) \not\vdash \sigma(\varphi)$  and  $\sigma(T), \sigma(\varphi)$  contain only a single propositional variable.

Moreover, if 
$$|\psi| = n$$
 and  $Var(\psi) = \{v_1, \dots, v_m\}$  then  

$$\sigma(v_i) = (p^{n+1-k} \rightarrow p^{2(n+1)}) \rightarrow ((p^{n+1} \rightarrow p^{2(n+1)}) \cdot (p^{2(n+1)-k} \rightarrow p^{2(n+1)}))$$
for some  $1 < k < n$ .

There is a function  $f \in \mathcal{O}(n^2)$  such that for any  $\psi \in T \cup \{\varphi\}$  we have  $|\sigma(\psi)| \leq f(|\psi|)$ .

# Time complexity

 Let *m* ∈ ℕ \ {0} be a fixed natural number. We denote by MTL<sup>+</sup><sub>m</sub> the positive fragment of MTL containing only *m* propositional variables.

## Time complexity

- Let *m* ∈ ℕ \ {0} be a fixed natural number. We denote by MTL<sup>+</sup><sub>m</sub> the positive fragment of MTL containing only *m* propositional variables.
- Given a logic L, TAUT(L) denotes the tautologicity problem of L.

# Time complexity

- Let *m* ∈ ℕ \ {0} be a fixed natural number. We denote by MTL<sup>+</sup><sub>m</sub> the positive fragment of MTL containing only *m* propositional variables.
- Given a logic L, TAUT(L) denotes the tautologicity problem of L.

#### Theorem

There exists a polynomial-time reduction from  $TAUT(MTL_m^+)$  to  $TAUT(MTL_1^+)$ .

The translation is of this form:

$$\varphi'(\boldsymbol{p}) = \bigvee_{(k_1,\ldots,k_m) \in \{1,\ldots,n\}^m} \sigma_{(k_1,\ldots,k_m)}(\varphi) \,.$$

## Space complexity

$$\varphi'(\boldsymbol{p}) = \bigvee_{(k_1,\ldots,k_m) \in \{1,\ldots,n\}^m} \sigma_{(k_1,\ldots,k_m)}(\varphi) \,.$$

#### Remarks

We have to fix the number of variables *m* otherwise the length of  $\varphi'$  is bounded only by  $n^n$ .

# Space complexity

$$\varphi'(\boldsymbol{p}) = \bigvee_{(k_1,\ldots,k_m) \in \{1,\ldots,n\}^m} \sigma_{(k_1,\ldots,k_m)}(\varphi) \,.$$

#### Remarks

We have to fix the number of variables *m* otherwise the length of  $\varphi'$  is bounded only by  $n^n$ .

However, to check that a formula  $\varphi$  is in TAUT(MTL<sup>+</sup>) it suffices to go through all the disjuncts in  $\varphi'$  and check if they belong to TAUT(MTL<sup>+</sup><sub>1</sub>) or not. In order to do this, we need "essentially" the same space.

For instance, if we would know that  $TAUT(MTL_1^+)$  is in PSPACE then we can infer that  $TAUT(MTL^+)$  is in PSPACE as well.

- ロ ト - ( 同 ト - ( 回 ト - ) 回 ト - ) 回
